Below Figures 1 & 2 (Birth Weight vs. Mother's Weight)

- **Name of Independent variable:** Mother's weight in pounds (lwt)
- **Name of dependent variable:** Birthweight in grams (bwt)
- **β_0 value (intercept):** 683.33
- **β_1 value (slope coefficient):** 4.44
- **R^2 value:** 0.091
- **1-sentence explanation:** This scatterplot and regression line show that there is a weak positive relationship between mother's weight in pounds and birth weight in grams, with a projected increase of 4.44 grams in birthweight for every 1 pound increase in mother's weight.

Below Figures 3 & 4 (Housing Insecurity vs. Total Population)

- **Name of Independent variable:** Total Population (total_population)
- **Name of dependent variable:** Crude prevalence of housing insecurity (housinsecu_crudeprev)
- **β_0 value (intercept):** 12.42
- **β_1 value (slope coefficient):** 0.00
- **R^2 value:** 0.0014
- **1-sentence explanation:** This scatterplot and regression line show that there is essentially no relationship between total population and the crude prevalence of housing insecurity, with a negligible projected change in housing insecurity prevalence per unit increase in population.

Below Figures 5 & 6 (Mental Health Disorders vs. Obesity Prevalence)

- **Name of Independent variable:** Crude prevalence of obesity (obesity_crudeprev)
- **Name of dependent variable:** Crude prevalence of mental health disorders (mhlth_crudeprev)
- **β_0 value (intercept):** 9.38
- **β_1 value (slope coefficient):** 0.21
- **R^2 value:** 0.2418
- **1-sentence explanation:** This scatterplot and regression line show that there is a positive relationship between the crude prevalence of obesity and mental health disorders, with a projected increase of 0.21 percentage points in mental health disorder prevalence for every 1 percentage point increase in obesity prevalence.
